1 Find the cat direction in each layer

My **cat** sleeps on the sofa all afternoon.

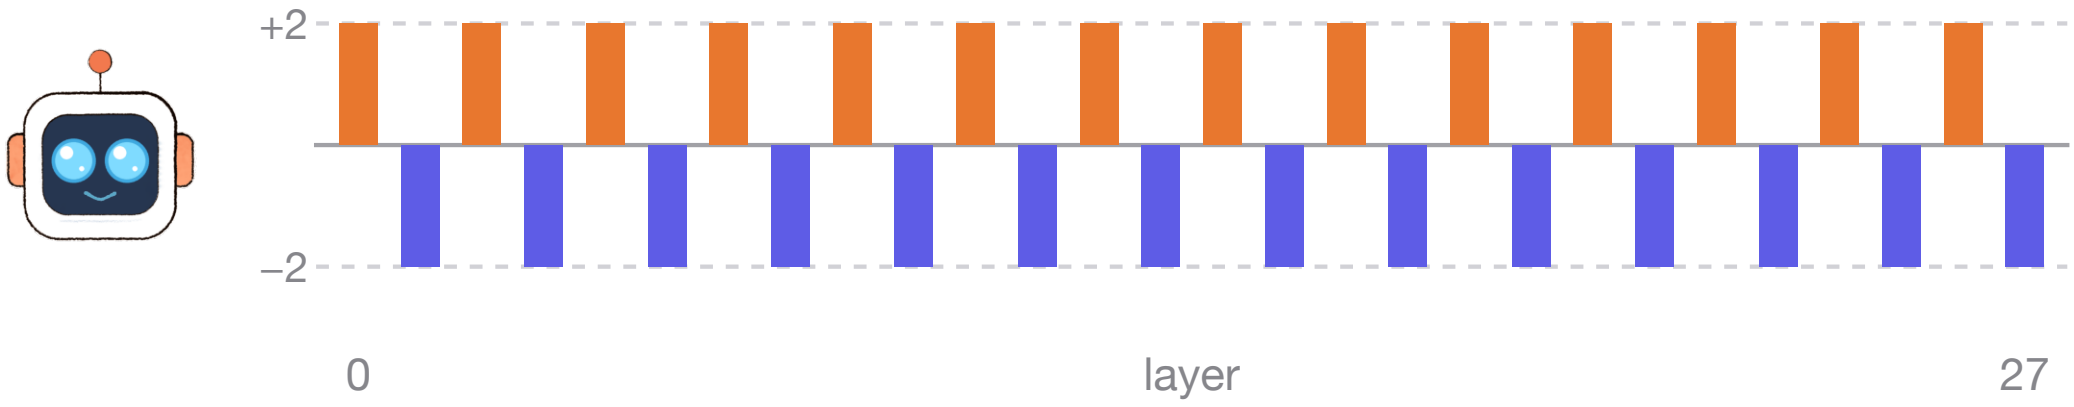
My **dog / rabbit / lamp / cup / …** sleeps on the sofa all afternoon.

Cat direction = average activation with “cat” minus with 20 other words,
over 202 sentences, separately at each of the 28 layers

2 Push it up or down on every layer, as the request says

As you write your reply, raise your internal ‘cat’ representation on even layers and lower it on odd layers. Describe how a bicycle works.

Target on every token of the reply:
+2 standard deviations on even layers, –2 on odd layers



3 Leave the words unchanged

A penalty pulls every next-token distribution toward the original model’s
when the same question comes with no request
